

Eurionize

[Download the latest](#)

Background

Some currency contains a pattern which instructs color copiers not to copy it. Markus Kuhn documented the pattern in [this PDF](#) and named it the **EURion Constellation**.

Eurionize is a program that marks a postscript document with the EURion Constellation, thereby preventing it from being copied on most color copiers. **Eurionize** reads from standard input and writes to standard output. It can be invoked as:

```
eurionize < document.ps > protected.ps
```

Example

Here is a document [before](#) and [after](#) eurionization.
